

Introduction to (Scientific) Programming with Python

Jelka Stojanov, Timo Flesch

MT 2021

University of Oxford

Outline

- Why Python?
- Practical
 - Part 1: Intro to Python
 - Part 2: Python for scientific programming
 - Part 3: Python for statistical data analysis
- Additional resources

Why Python?

It's a general-purpose programming language, used to power many of the apps you use every day!

Why Python?

There are free (!) add-ons for everything:

Create your own experiments!

Organise and analyse numerical data!

Make beautiful figures!

Perform sophisticated statistical analyses!

Hop on the machine learning hype train!

Why Python?

It's just better than its competitors!

>

Matlab is very expensive! Python is **free**. When using the right packages/add-ons, Python has the same functionality and syntax as Matlab.

>

Python is much easier to learn, as the **syntax is less complex**. At least for science, there is a **better community/ecosystem**. Some Python packages run C(++) code in the background, which makes them almost as fast as their C++ counterparts.

>

Python is a **general-purpose language**. It can be used for almost everything. R was developed for statistical analyses.

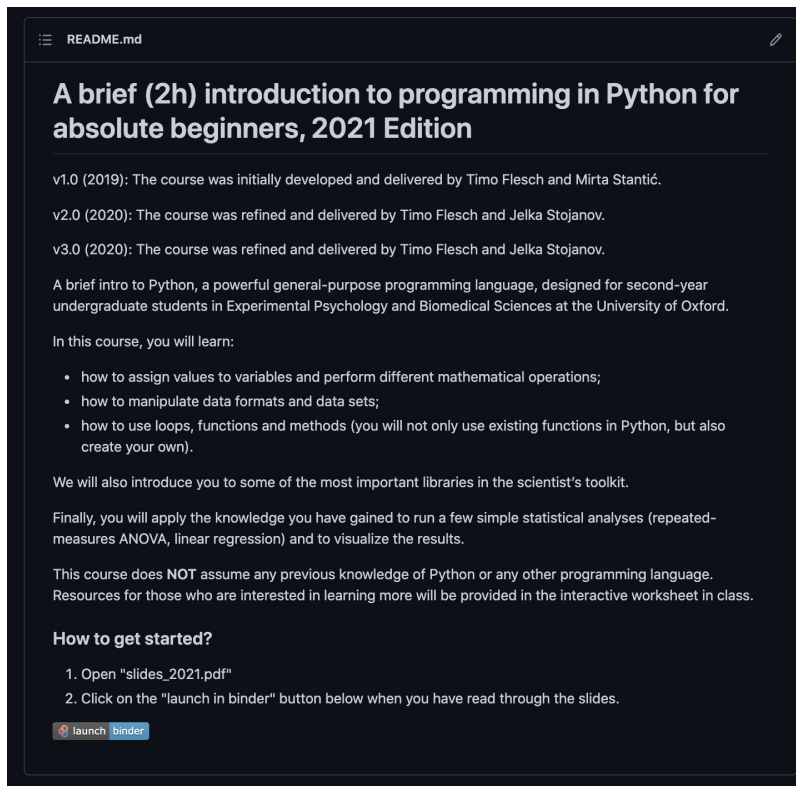

>

Again, much **simpler syntax**. You can achieve the same results with fewer lines of code.

Python Practical

1. Go to <http://www.github.com/timoflesch/intro2python>

The screenshot shows a GitHub repository page for a Python course. The title is "A brief (2h) introduction to programming in Python for absolute beginners, 2021 Edition". The README text describes the course's history (versions 1.0, 2.0, and 3.0) and its purpose for second-year undergraduate students. It lists learning objectives such as assigning values to variables, manipulating data formats, and using loops and functions. It also mentions the introduction of scientific libraries and the application of statistical analyses. A "How to get started?" section provides instructions to open a PDF and click a "launch in binder" button, which is visible at the bottom of the page.

README.md

A brief (2h) introduction to programming in Python for absolute beginners, 2021 Edition

v1.0 (2019): The course was initially developed and delivered by Timo Flesch and Mirta Stantić.

v2.0 (2020): The course was refined and delivered by Timo Flesch and Jelka Stojanov.

v3.0 (2020): The course was refined and delivered by Timo Flesch and Jelka Stojanov.

A brief intro to Python, a powerful general-purpose programming language, designed for second-year undergraduate students in Experimental Psychology and Biomedical Sciences at the University of Oxford.

In this course, you will learn:

- how to assign values to variables and perform different mathematical operations;
- how to manipulate data formats and data sets;
- how to use loops, functions and methods (you will not only use existing functions in Python, but also create your own).

We will also introduce you to some of the most important libraries in the scientist's toolkit.

Finally, you will apply the knowledge you have gained to run a few simple statistical analyses (repeated-measures ANOVA, linear regression) and to visualize the results.

This course does **NOT** assume any previous knowledge of Python or any other programming language. Resources for those who are interested in learning more will be provided in the interactive worksheet in class.

How to get started?

1. Open "slides_2021.pdf"
2. Click on the "launch in binder" button below when you have read through the slides.

 launch binder

Python Practical

2. Click on the “launch binder” button:

How to get started?

1. Open "slides_2021.pdf"
2. Click on the "launch in binder" button below when you have read through the slides.

Python Practical

3. Stare at this screen for a while:

Thanks to Google Cloud, OvH and GESIS Notebooks for supporting us 🙏!

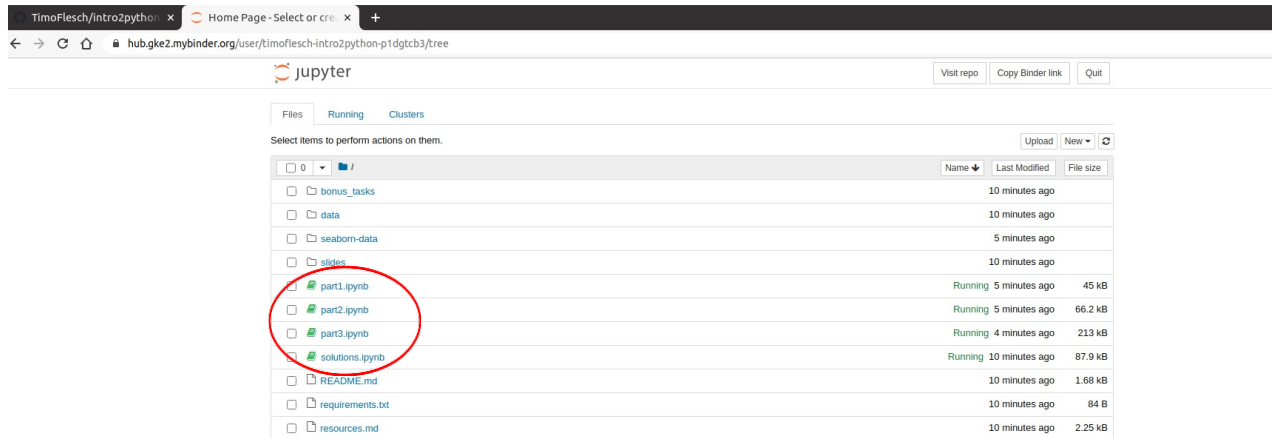

Starting repository: TimoFlesch/intro2python/master
New to Binder? Check out the [Binder Documentation](#) for more information

Python Practical

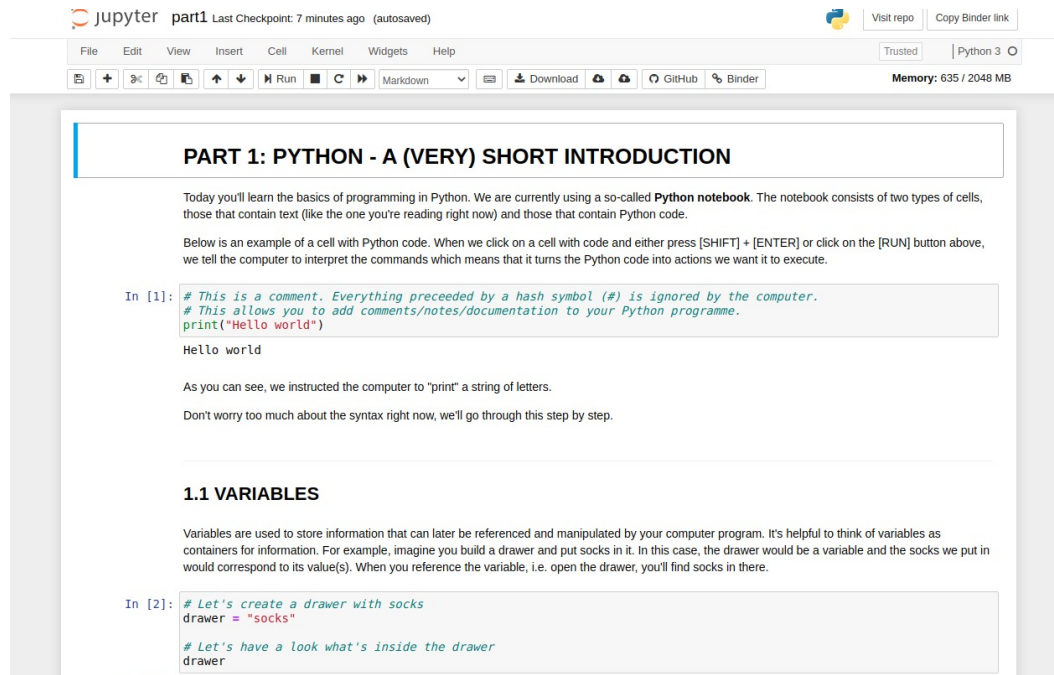

4. Now this screen (or similar) should show up:

From here you can open the worksheets that we have provided for you. This will run an interactive Python session in your browser, where you can write and execute your own Python programs.

Python Practical

5. You are now running an interactive worksheet with Python code in your web-browser. **Have fun** 😊

The screenshot shows a Jupyter Notebook interface. At the top, the Jupyter logo and 'part1' are visible, along with a 'Last Checkpoint: 7 minutes ago (autosaved)' message. On the right, there are links for 'Visit repo' and 'Copy Binder link'. Below this is a menu bar with 'File', 'Edit', 'View', 'Insert', 'Cell', 'Kernel', 'Widgets', and 'Help'. To the right of the menu bar are 'Trusted' and 'Python 3' indicators. A toolbar contains icons for file operations, running, and saving. The main content area is titled 'PART 1: PYTHON - A (VERY) SHORT INTRODUCTION'. It contains two text blocks: one explaining the basics of Python notebooks and another explaining how to execute code. Below the first text block is a code cell with the following content:

```
In [1]: # This is a comment. Everything preceeded by a hash symbol (#) is ignored by the computer.
# This allows you to add comments/notes/documentation to your Python programme.
print("Hello world")
```

 The output of this cell is 'Hello world'. Below the code cell is another text block explaining the 'print' function. The second text block is titled '1.1 VARIABLES' and explains how variables are used to store information. Below this text block is a code cell with the following content:

```
In [2]: # Let's create a drawer with socks
drawer = "socks"

# Let's have a look what's inside the drawer
drawer
```

Outlook

Learn to code!

1. A complete course <https://www.learnpython.org>
2. Ditto <https://www.w3schools.com/python/>
3. Advanced course <https://automatetheboringstuff.com>

How to install Python?

1. Just Python <https://www.python.org/downloads/>
2. Jupyter Notebook (that you have used/will use today) <https://jupyter.org/install>
3. Anaconda (a collection of useful packages and other software for data scientists)
<https://www.anaconda.com/distribution/>

Outlook

Text editors

1. Atom <https://atom.io/>
2. Visual Studio Code <https://code.visualstudio.com/>
3. Sublime <https://www.sublimetext.com/>

All-in-one solutions (similar to the Matlab interface or R-Studio)

1. Spyder (free) <https://www.spyder-ide.org/>
2. Pycharm (free basic and commercial pro version) <https://www.jetbrains.com/pycharm/>

Outlook

Coding challenges

1. Hackerrank <https://www.hackerrank.com/>
2. Leetcode <https://leetcode.com>

Python for psychologists
